

For my capstone project, I will be working alongside Professor Manisha Goel to analyze the factors that affect a film's performance at the domestic box office. In particular, I will be examining how much of the box office result derives from film-specific attributes (e.g., the average rating of the director's body of work on IMDb) compared to broader economic conditions at the time of release (e.g., the value of the consumer sentiment index). Likewise, I will be exploring how this balance has changed over time, say, if the contribution of the director's ratings was $x\%$ in 2015 vs $y\%$ in 2025.

Data will be drawn and scraped from FRED, IMDb's database, Box Office Mojo, and The Numbers, and the analysis will likely follow a log-linear regression.
